

Student Timetable Management system vision statement

Problem statement: For many students, one of the most important commodities is time and if not managed well, it might create chaos in their life. To fit school, eating, exercising and studying in maybe just one day might be a hassle but with the right tool it can work and that is where this Timetable Management System comes handy.

Overview: The student timetable management system as its name suggests is a platform made for students to help managing their schedule. The application gives an overview of the user's schedule and lets the user edit it. The application is simple but at the same time complex overview of the whole schedule which in turn makes time management more easier and somewhat automated.

Vision/How it works: Is that you have the empty timetable of a week, the days are lined vertically and the hours are lined horizontally. On the right side of the application is where you can create new events or select events from the calendar and edit them. You can choose whether you want to get notified of the event beforehand and choose the time of the notification for important events.

Target audience: This application is the most suited for the more busier people. Many people with regular schedules sometimes have special occasions to attend to and so it is good to keep track of them in their regular life. The application itself is made more specifically for students, but people with a lot of different appointments and occasions in their life will find this application very useful.

Key features:

- Add and edit life events
- Different colouring for different events
- Set notifications for events
- Customizable outlook
- Clear and complex view of the whole calendar

Goals and Objectives:

- Create a fully functional Student Timetable Management System within the project timeline of 8-weeks
- Make student timetable management more easier and automated
- Get user feedback during development and apply it and make changes if necessary
